for bone resorption control, esp. treatment of osteoporosis Claim 22; Page 74; 183pp; Japanese.
This sequence encodes full length osteoclastogenesis inhibitory factor (OCIF) 4. The OCIF of the invention has a molecular weight by SDS-PAGE Of ND under reducing conditions and 120 ND under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                         22-APR-1997 (first entry)
Osteoclastogenesis inhibitory factor 4 coding sequence.
Osteoclastogenesis inhibitory factor; OCIF; heparin; bone resorption;
                                                                                                                                                                                                                                                                                                                                                    DNA encoding osteoclastogenesis inhibitory factor protein - useful

Claim 91; Page 152-161; 183pp; Japanese.

The sequences given in T33182-83 represent fragment of the genomic DNA encoding the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 50 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   419

This sequence encodes full length osteoclastogenesis inhibitory factor (OCIF) 5. The OCIF of the invention has a molecular weight by SDS-PAGE 06 60 KD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                           121 tgtgacaaatgtcctcctggtacctacctaaaacaacatgtacagcaaagtggaagac 180

osteo clastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CCR4 in which amino acids 123-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis. This sequence is not given in the specification and is derived from the protein sequence and the wild type OCIF CDNA sequence given in T36685. Sequence 432 BP; 116 A; 117 C; 106 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ctatactgcagccccgtgtgcaaggagctgcagtacgtcaagcaggagtgcaatcgcacc 300

DNA ehcoding osteoclastogenesis inhibitory factor protein – useful for bone resorption control, esp. treatment of osteoporosis Claim 84; Page 149-150; 183pp; Japanese.

Morinaga T; Yasuda H;

```
and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 degr. Cor 30 mins at 56 degr. C, and is lost after 10 mins at 90 degr. C. OCIF is useful in the control of bone resorption and therefore
This sequence encodes a mutated version of the full length osteoolastogenesis inhibitory factor (OOIF) of the invention. This sequence encodes OOIF-CBSp in which amino acids 167-380 of the mature protein have been deleted. These amino acid changes have been caused by the introduction of a restriction site. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed ont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-APR-1997 (first entry)

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes a mutated version of the invention. This sequence encodes OCIF-CDD1 in which amino acids 177-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg. C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis. This sequence is not given in the specification and is derived from the protein sequence and the wild type OCIF cDNA sequence given in T35685. Sequence 594 BP; 176 A; 152 C; 136 G; 130 T;

for bone resorption control, esp. treatment of osteoporosis Claim 66. Page 145; 183p; Japanese.

This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-DD2 in which amino acids 252.380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240

          This sequence encodes a mutated version of the full length osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CSph in which amino acids 280-380 of the mature protein have been deleted and replaced by Ser-Leu-Asp. These amino acid changes have been caused by the introduction of a restriction site.

The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kb under reducing conditions and 120 kb under non-reducing productions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis. Sequence 966 BP; 301 A; 228 C; 226 G; 211 T;

Claim 54, Page 141-142; 183pp; Japanese.

This sequence encodes a mutated version of the full length octeoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-DDD1 in which amino acids 178-252 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis. Sequence 981 BP; 312 A; 238 C; 218 G; 213 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
This sequence encodes mutated version of the full length of steoldstogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-DDD2 in which amino acids 253-356 of the mature protein have been deleted. The OCIF of the invention has a molecular non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. of 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                 ö

This sequence encodes a mutated version of the full length obsteoclassis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CC in which maino acids 311-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. ociF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

osteo clastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CR4 in which amino acids 123-164 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under nor-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C. or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption and therefore in the treatment and sequence 1080 BP. 345 M. 256 C. 244 G. 235 T;

sequence encodes OCIF-CBst in which Gln371 is substituted with Leu and amino acids 373-380 of the mature protein have been deleted. These amino acid changes have been caused by the introduction of a restriction site. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing on conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the provention of disorders of bone resorption, e.g. osteoporosis.
                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      22-APR-1997 (first entry)

osteoclastogenesis inhibitory factor (OCIF) of the invention. This sequence encodes OCIF-CL in which amino acids 379-380 of the mature protein have been deleted. The OCIF of the invention has a molecular weight by SDS-PAGE of 60 kD under reducing conditions and 120 kD under non-reducing conditions. The protein is adsorbed onto cation-exchangers or heparin and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the control of bone resorption and therefore in the treatment and prevention of disorders of bone resorption, e.g. osteoporosis.

                                                                                                                                          double-stranded cons was size selected, ligated to Eco RI adapters (pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT/T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 53. Library went constructed by Bento Soares and M. Fatima Bonaldo. The adult brain RNA was provided by Dr. Donald H. Gilden. Tissue was acquired 17-18 hours after death which occurred in consequence of a ruptured actic aneurysm. RNA was prepared from a pool of tissues representing the following areas of the brain: frontal, parietal, temporal and occipital cortex from the left and right hemispheres, subcortical white matter, basal ganglia, thalamus, cerebellum,

The mRNA sources were 1) 7 day germinated eticlated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       l (bases 1 to 472)
